

FIELD DEMONSTRATION SUMMARY: BARIADI COTTON CASE STUDY

Location

Bariadi District, Simiyu Region, Tanzania

Objective

To demonstrate the performance of Navyakosh Organic Bio-Fertilizer under real farming conditions compared with untreated plots and manure-treated plots.

Demonstration Setup

Three comparison plots were observed:

- ✓ Plot without fertilizer
- ✓ Plot treated with traditional manure
- ✓ Plot treated with Navyakosh Organic Bio-Fertilizer

Observed Results (Within One Month)

- ✓ Plants treated with Navyakosh appeared thicker and stronger
- ✓ Leaves were deep green indicating strong nutrient uptake
- ✓ Higher density of plants and improved field uniformity
- ✓ Increased formation of flower buds suggesting higher yield potential

Resilience to Heavy Rainfall

Despite recent heavy rains in the area, the cotton crop treated with Navyakosh fertilizer remained strong and upright, showing good resilience compared to surrounding fields.

Farmer Testimonial

The participating farmer reported that he had never previously witnessed such strong performance in cotton crops under similar rainfall conditions. The farm has since attracted attention from neighboring farmers who are interested in adopting the fertilizer in the next planting season.

Conclusion

The Bariadi demonstration indicates strong potential for Navyakosh Organic Bio-Fertilizer to improve crop performance, soil health, and farmer productivity when used as part of sustainable farming practices.
